

New system for tire pressure data monitoring on Tire Endurance / RR Test Benches

**+ Data
+ Control
+ Safety**

Upgrade your Endurance / RR test bench

Now, tire manufacturers can easily **monitor** and **record** all the **tire pressure data** during tire testing.

Our new **TPMS system** is composed of a **pressure sensor** to be installed in the wheel before the test and a **device for data acquisition and communication** with the test bench.

The system is integrated with the Test Industry test bench software, and the acquired data can be **stored & integrated into the test reports.**

The system is provided with **Ethernet** and **RS485** interfaces, allowing easy integration into the measuring environment.

Two types of sensors are available:

For **PCR tire** → up to **8 bar**

For **TBR tire** → up to **14 bar**

The new system can be installed on new machines as extra option or on existing machines with a system upgrade.
